AUTOMATED NETWORK REQUEST MANAGEMENT

Network service requests

Customer journey map | Project Design Phase-II | 30 October 2026 | Team ID:

Basis of this map
Based on the project's ServiceNow configuration and development-instance testing (Personal Developer Instance). No customer interviews or surveys were carried out, so moments reflect observed behaviour and known limitations.

SCENARIO

Submitting, approving, tracking and receiving the resolution of a network service request

Persona: Requester (employee)

	Entice	Enter	Engage	Exit	Extend
	How does a requester become aware of this process?	What does the requester experience as the request begins?	In the core moments, what happens to the request?	What happens as the request is finished?	What happens after the request is resolved?
Steps What does the requester (and supporting team) typically experience?	**Need a network service** An employee needs a new or existing network connection or related service. **Visit Service Portal** The requester opens the ServiceNow Service Portal at /sp. **Find the catalog item** They go to the Network Request catalog item under network services.	**Open the form** The form loads with Type of Connection = New and Mode of Payment = UPI by default. **Select requester** 'Opened on behalf of' fills User Name and Email from the chosen user. **Enter details** Requested For, Mobile Number, connection type, Total Amount, payment mode and Address. **Existing ID and submit** For Existing connections an Existing ID is entered, then the request is submitted.	**Request recorded** The Network Request flow creates a Database Tables record (Approval Status = Requested) and sends the 'Request has been Created' email. **Approval requested** An approval record is created ('Waiting for approval'); approver in testing: System Administrator. **Decision applied** Approved: ITIL User and Approved. Else branch: Abraham Lincoln and Rejected (configured). **Task worked** A team member manually creates a Network Task Table record and updates Work Status and Work Notes.	**Work completed** The team sets the task's Work Status to Completed. **Resolution email** The Network Task Completion Email flow sends 'Request has been Resolved' to the Requested For user. **Requester informed** The requester reads the email (inbox delivery depends on mail set-up).	**Records retained** Request and task records keep Approval Status, Work Status and Work Notes. **Refer back** The request number in the first email lets the requester refer to the request later. **More services** Dashboards, auto-created tasks and new request types are possible next steps.
Interactions What interactions happen at each step along the way? People: who do they see or talk to? Places: where are they? Things: which digital touchpoints are used?	**Things** Web browser and the Service Portal (/sp). **Things** Service Catalog and the Network Request catalog item.	**Things** Catalog form with seven main variables and the Requester Information variable set. **Things** Catalog UI Policy 'Show Existing ID for Existing Connection' shows and requires Existing ID only when relevant. **Things** Mandatory-field settings block incomplete submissions.	**Things** Flow Designer flow 'Network Request' and the Database Tables record. **People** Approver (System Administrator) acts on the approval record, shown in a related list on the request record. **People** Network Team member works the Network Task Table record. **Things** ServiceNow Send Email action and the Outbox.	**Things** Flow 'Network Task Completion Email' (Record Updated trigger, Work Status changes to Completed). **Things** Recipient: Requested For user's email; message previewed in the Outbox.	**Things** Custom tables and related lists in ServiceNow. **Things** Request number from the acknowledgement email.
Goals & motivations At each step, what is the person's primary goal? ("Help me..." or "Help me avoid...")	Help me find the right place to ask for a network service.	Help me enter my details quickly and correctly. Help me avoid fields that do not apply to me.	Help me know my request was received and is moving. Help me get a clear approval decision. Help me see which request each task belongs to.	Help me know my request has been resolved.	Help me refer back to what was requested and its outcome.
Positive moments What steps work well? (Taken from behaviour observed during development testing.)	One entry point: the Network Request catalog item in the Service Portal.	Defaults and auto-filled user details reduce typing. Existing ID appears only for Existing connections (tested for New and Existing).	A test request produced a record with Approval Status = Requested and a linked approval record. After approval the record showed Approved and ITIL User.	Completing a task generated the resolution email; the Outbox preview showed the requester's name.	Approval Status and Work Status are kept separate, so progress is clear.
Negative moments What steps are limited, confusing or incomplete? (Known limitations of the current prototype.)		Mobile Number has no custom ten-digit validation script. Phone Number stays empty if the user's profile has no mobile phone.	An earlier run showed missing catalog-variable warnings (a later test succeeded). The task record is created manually, not by the flow. The rejection branch is configured but not freshly tested.	Outbox state Ready shows the email was queued, not that it reached an inbox.	No dashboards, reporting or service-level tracking yet.
Areas of opportunity How might we make each step better? (Future enhancements, not implemented.)	How might we guide requesters to the right catalog item?	Add stronger field-level validation, such as a ten-digit mobile number check. Add more request types, e.g. VPN access or device provisioning.	Create the Network Task Table record automatically after approval. Re-test the rejection branch and add regression tests. Connect provisioning tools via Integration Hub.	Monitor email delivery and handle failures.	Add dashboards for request volume, approval time and task completion. Define service-level targets and a deployment / rollback procedure.

Dashed note = future idea, not implemented. Task creation is a manual step in the current version. An Outbox state of Ready does not prove inbox delivery.
