Acceptance Testing
UAT Execution & Report Submission

Date	30 October 2026
Team ID	
Project Name	Automated Network Request Management
Maximum Marks	4 Marks

1. Purpose of Document

The purpose of this document is to briefly explain the test coverage and open issues of the **Automated Network Request Management** project at the time of release to User Acceptance Testing (UAT). The application is a ServiceNow scoped low-code prototype running in a Personal Developer Instance. The results below come from testing carried out by the project team during development; no separate business-user sign-off has been recorded, and no screenshots are embedded in this report.

2. Defect Analysis

This report would show the number of resolved or closed bugs at each severity level and how they were resolved. No formal defect log with severity levels was maintained during development, so counts are not reported (shown as –) rather than estimated. The issues that are known are listed in Section 4.

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	–	–	–	–	–
Duplicate	–	–	–	–	–
External	–	–	–	–	–
Fixed	–	–	–	–	–
Not Reproduced	–	–	–	–	–
Skipped	–	–	–	–	–
Won't Fix	–	–	–	–	–
Totals	–	–	–	–	–

– = not recorded.

3. Test Case Analysis

This report shows the number of test scenarios that have passed, failed and are untested. The counts are of the 12 documented scenarios in the detailed table below, not of a formal automated test suite. 'Pass' means the behaviour was observed in the development instance; it does not mean exhaustive or regression testing has been done.

Section	Total Cases	Not Tested	Fail	Pass
Catalog Request Form	3	0	0	3
Requester Information	3	0	0	3
Approval Flow	3	1	0	2
Task Tracking	1	0	0	1
Email Notifications	2	1	0	1
Totals	**12**	**2**	**0**	**10**

Fail = 0 means no failed execution was recorded for these scenarios; the earlier diagnostic warnings are covered in Section 4.

Detailed Test Cases

ID	Section	Scenario	Expected result	Observed result	Status
TC-01	Catalog Request Form	Submit a Network Request from the Service Portal.	A request and a Database Tables record are created with the submitted values (Approval Status = Requested).	Observed in a later practice request (example RITM0010009: 1234567890, 15000, UPI, new, hyd, admin). Earlier run showed missing-variable warnings.	**Pass**
TC-02	Catalog Request Form	Select Type of Connection = Existing.	Existing ID field is visible and mandatory.	Observed as expected.	**Pass**
TC-03	Catalog Request Form	Select Type of Connection = New.	Existing ID field is hidden and not required.	Observed as expected.	**Pass**
TC-04	Requester Information	Change the 'Opened on behalf of' user.	User Name updates.	Observed as expected.	**Pass**
TC-05	Requester Information	Change the 'Opened on behalf of' user.	Email updates.	Observed as expected.	**Pass**
TC-06	Requester Information	Select a user whose profile has a mobile phone number.	Phone Number populates; if the profile has none, nothing can populate.	Populated when the profile contained a mobile number.	**Pass**
TC-07	Approval Flow	Submit a practice request.	Record in Requested status and an approval record (approver: System Administrator).	Observed as expected.	**Pass**
TC-08	Approval Flow	Approve the request.	Approval Status = Approved; Assignment to = ITIL User.	Record updated as expected.	**Pass**
TC-09	Approval Flow	Reject the request.	Approval Status = Rejected; Assignment to = Abraham Lincoln.	Branch is configured; no fresh rejection run has been recorded.	**Not Tested**
TC-10	Task Tracking	Create a Network Task Table record linked to a request and Database Tables record.	Task is created with a generated number (for example NTT0000109).	Created manually for the demonstration; the flow does not create it.	**Pass**
TC-11	Email Notifications	Set the task's Work Status to Completed.	Email 'Request has been Resolved' is generated for the Requested For user.	Email appeared in the Outbox (state Ready) and its preview showed the user's name. Inbox delivery was not verified.	**Pass**
TC-12	Email Notifications	Submit a request and check the request-created email.	Email 'Request has been Created' with request number and two business working days.	Configured; the Outbox entry and preview still need to be confirmed and evidenced.	**Not Tested**

4. Known Issues and Open Items

ID	Issue / observation	Status / resolution
KI-1	An earlier flow execution showed warnings for missing catalog variables (address, total_amount, requested_for, mode_of_payment, mobile_number, type_of_connection).	A later test record held the submitted values. Not conclusively eliminated for all cases; regression testing recommended.
KI-2	The Network Task Table record is created manually; the Network Request flow does not create it.	Current limitation; automatic creation is future work.
KI-3	The rejection branch is configured but has no fresh execution record.	Open: run TC-09 and record the result.
KI-4	An Outbox state of Ready shows an email was queued, not that it reached an inbox.	Limitation: delivery monitoring is future work.
KI-5	Evidence for the request-created email (TC-12) is not yet confirmed.	Open: verify the Outbox entry and preview.
KI-6	No custom ten-digit validation script exists for Mobile Number.	Limitation: stronger field validation is future work.
KI-7	ACLs are a development-level configuration.	Open: review for least-privilege access before production.
