PROJECT DEMONSTRATION

Automated Network Request Management

A ServiceNow scoped low-code application: request, approval, task tracking and email notification

Platform	ServiceNow Personal Developer Instance (App Engine Studio, Service Portal, Flow Designer)
Demonstrated by	Screen recording of the running application, 26 October 2026 (screenshots taken from the recording)
Document date	2 November 2026

1. About this demonstration

This document walks through the application from a requester submitting a Network Request to the resolution email, one step at a time, with a screenshot for each stage. The request numbers shown (for example REQ0010011 and RITM0010011) come from the recorded run and will differ in your own instance. The recipient email address in the Outbox screenshots has been hidden.

2. What the demonstration covers

Step	Stage	Feature shown
1-2	Open the request form	Service Portal (/sp), catalog item, default values (New, UPI)
3	Conditional field	Existing ID shown and mandatory only for Existing connections (Catalog UI Policy)
4	Requester information	User Name and Email fill after choosing a user
5	Submit	Completed form and Request Summary
6	Acknowledgement	'Request has been Created' email generated in the Outbox
7	Record and approval	Database Tables record (Requested) with a linked approval record
8-9	Approval decision	Approver approves; record shows Approved and ITIL User
10-11	Task tracking	Network Task Table record created manually; Work Status set to Completed
12	Resolution	'Request has been Resolved' email generated in the Outbox
13	Under the hood	Network Request flow in Flow Designer

3. Before you start

- A ServiceNow Personal Developer Instance with the Automated Network Request Management application installed and the two flows activated.
- A browser logged in as an administrator (the System Administrator user acts as the approver in this demo).
- At least one user to choose in 'Opened on behalf of'. Phone Number fills only if that user's profile has a mobile phone number.
- Emails are checked in the instance Outbox; no external mail delivery is needed.

4. Step-by-step walkthrough

Step 1: Find the Network Request item

Action: Open the Service Portal at `/sp` and search for 'Network Request'.

Expected result: The Network Request catalog item appears in the search results.

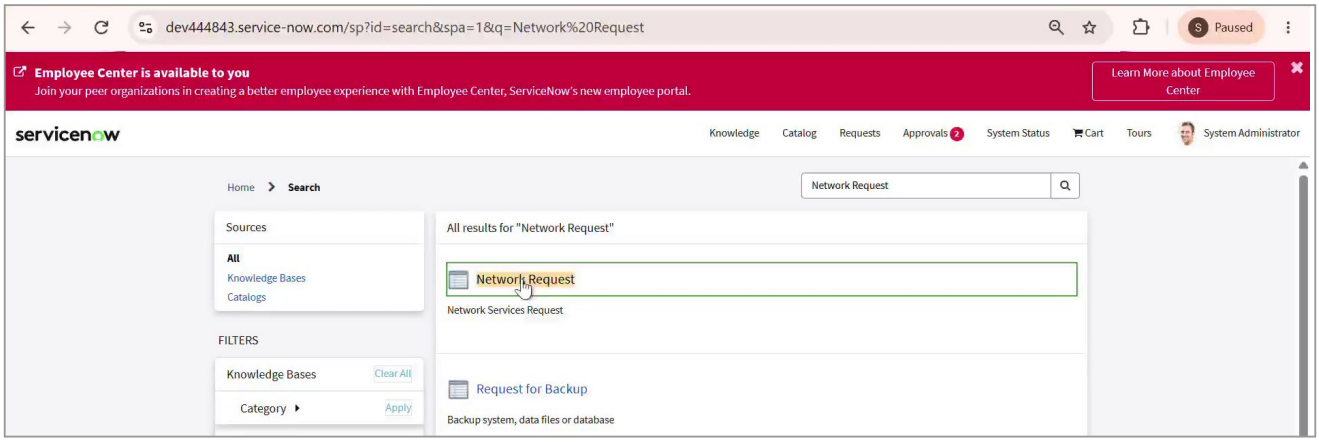

Figure 1: Service Portal search result showing the Network Request catalog item.

Step 2: Open the request form

Action: Open the Network Request item.

Expected result: The form shows the Requester Information section and the request fields. Type of Connection is New and Mode of Payment is UPI by default; Existing ID is hidden.

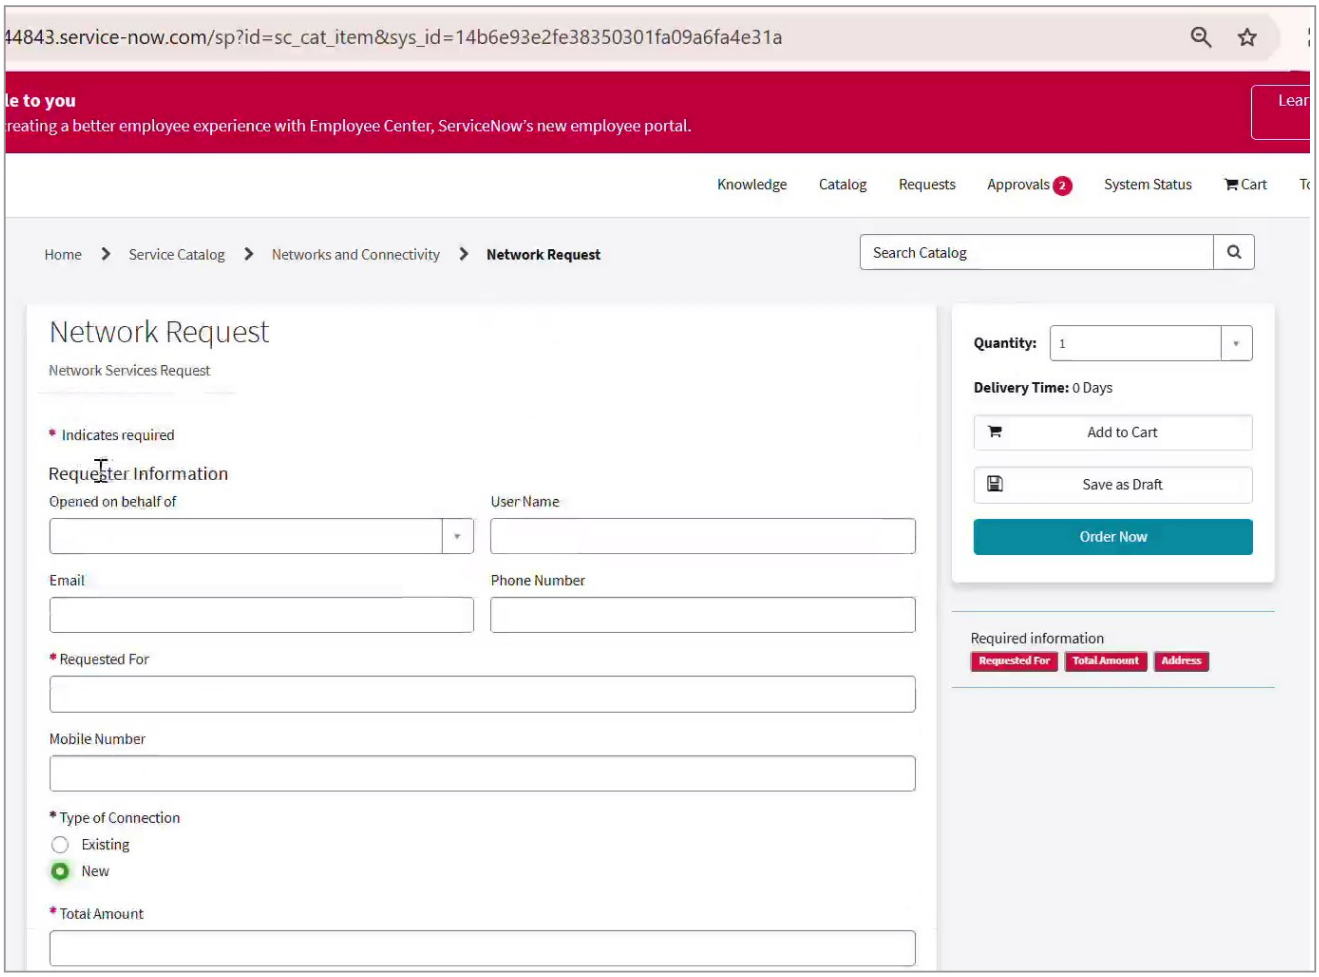

Figure 2: Network Request form with Type of Connection = New.

Step 3: Show the conditional Existing ID field

Action: Select Existing under Type of Connection.

Expected result: 'Enter your Existing ID' appears and is mandatory (it is listed under Required information). Choosing New hides it again.

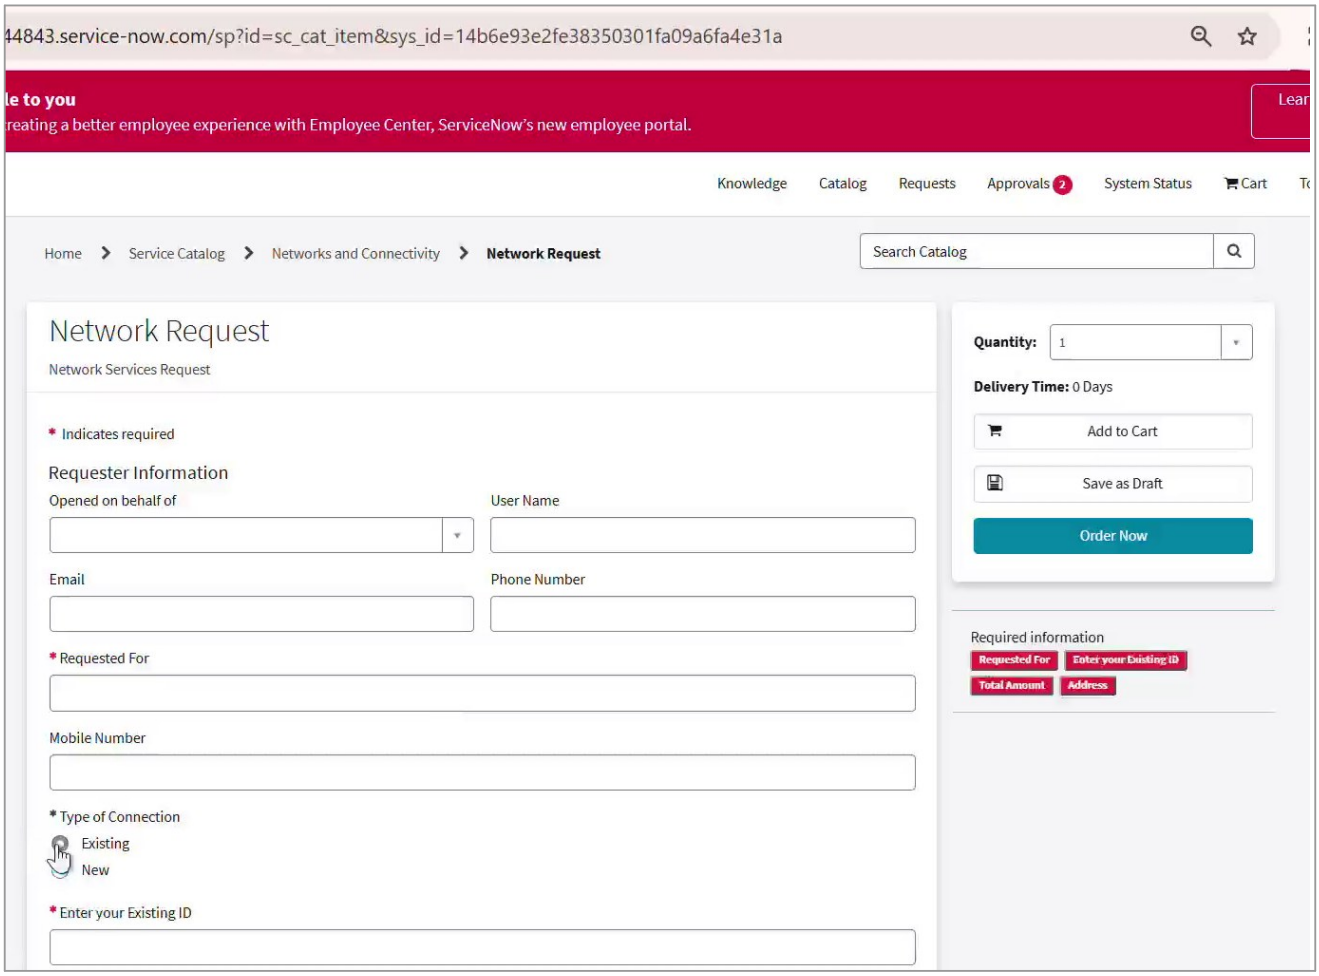

Figure 3: Existing selected; the Existing ID field is shown and mandatory.

Step 4: Fill requester information

Action: Choose a user in 'Opened on behalf of'.

Expected result: User Name and Email fill in. Phone Number fills only when the user's profile has a mobile phone number; it stayed empty for this user.

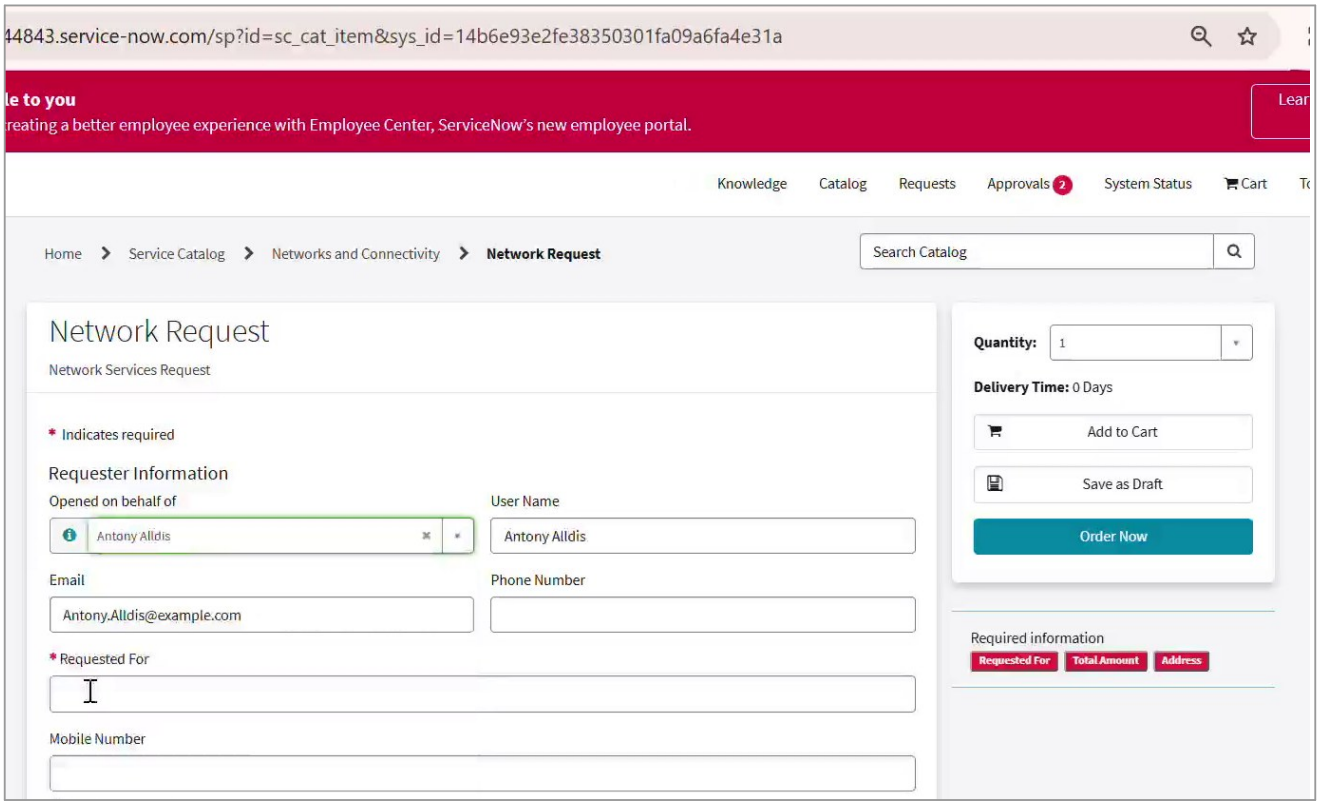

Figure 4: Requester Information after choosing a user.

Step 5: Complete and submit the request

Action: Enter Requested For, Mobile Number, Total Amount, Mode of Payment and Address, then choose Order Now.

Expected result: A Request Summary page is shown with the request number.

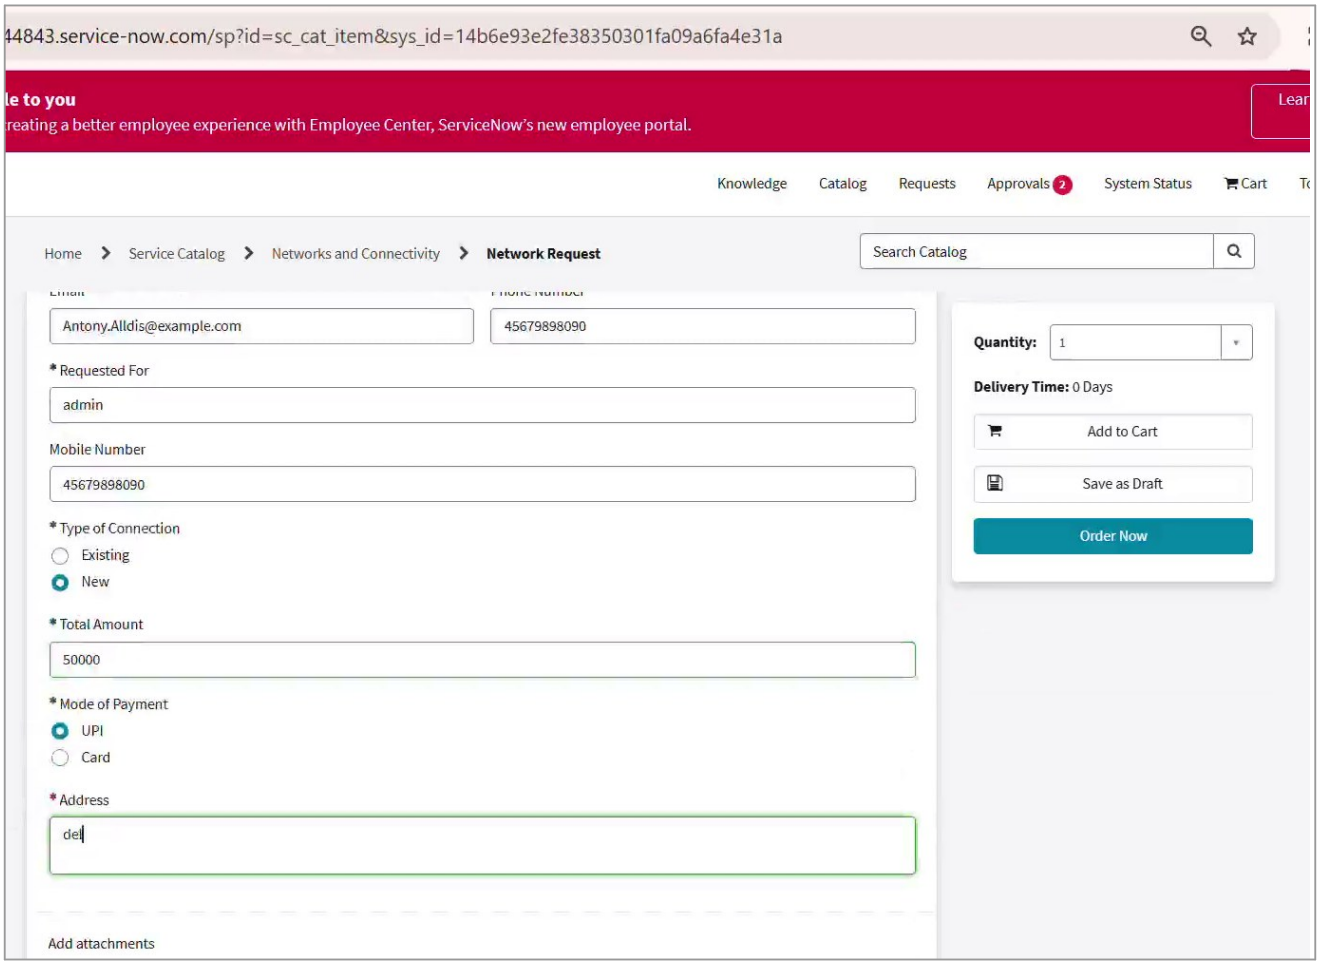

Figure 5: Completed request form (New connection).

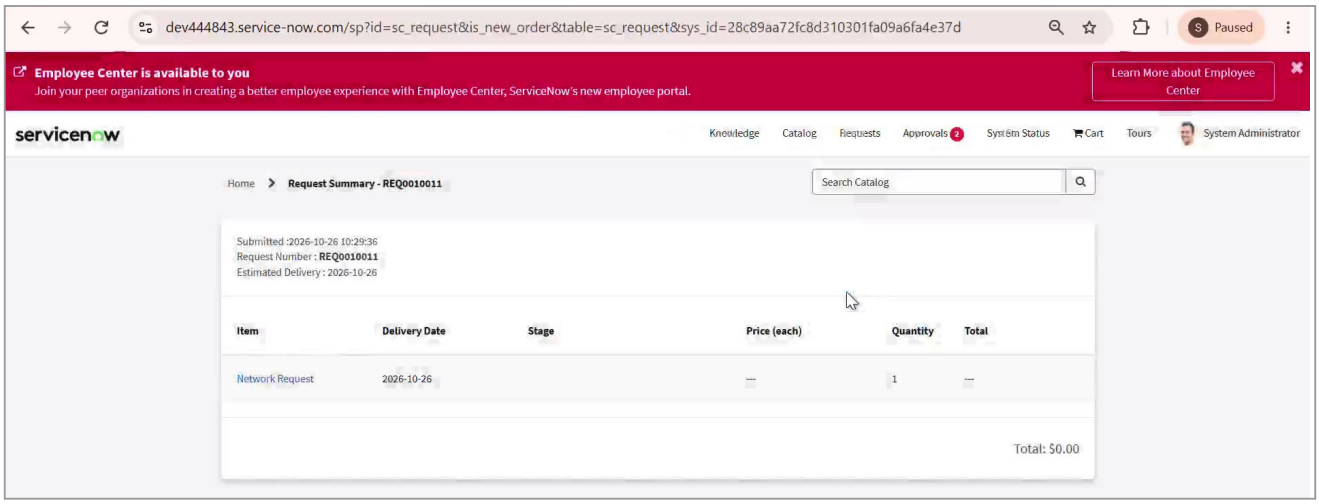

Figure 6: Request Summary after ordering (REQ0010011).

Step 6: Check the acknowledgement email

Action: In the instance, open the Outbox and find 'Request has been Created'; use Preview Email.

Expected result: The email is in state Ready and says the request was received with its request number and will be resolved within 2 business working days.

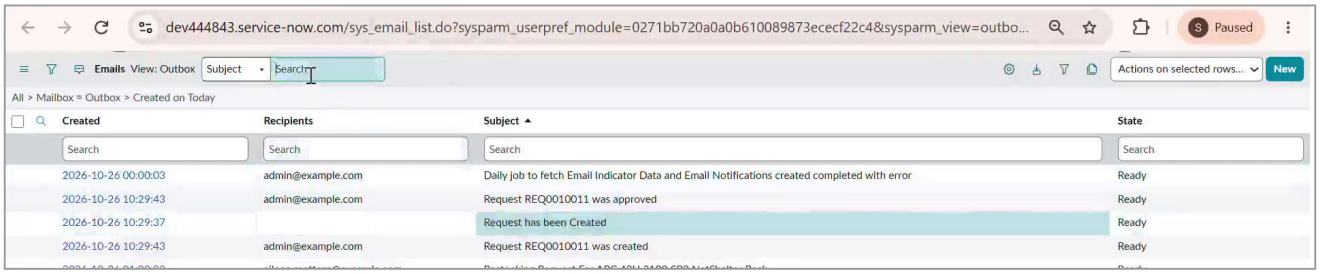

Figure 7: Outbox entry 'Request has been Created' (State Ready; recipient hidden).

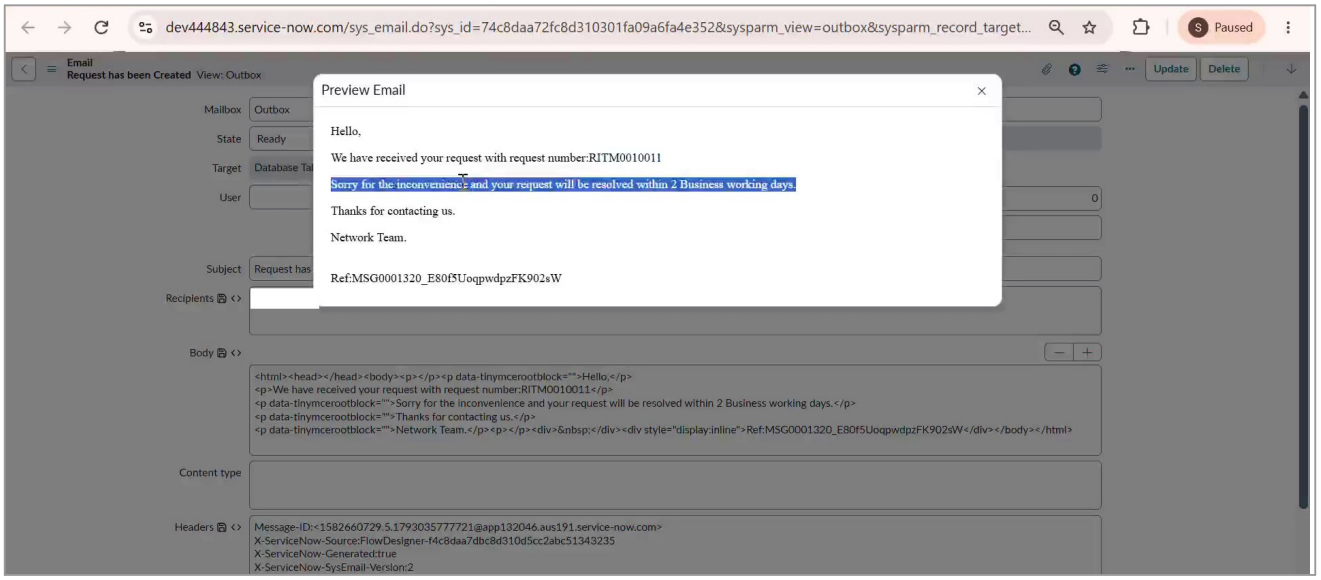

Figure 8: Email preview showing request number RITM0010011 (recipient hidden).

Step 7: View the request record and its approval

Action: Open the Database Tables record created by the Network Request flow.

Expected result: Approval Status = Requested, the submitted values are stored, and a related Approval Request record (approver: System Administrator) is listed.

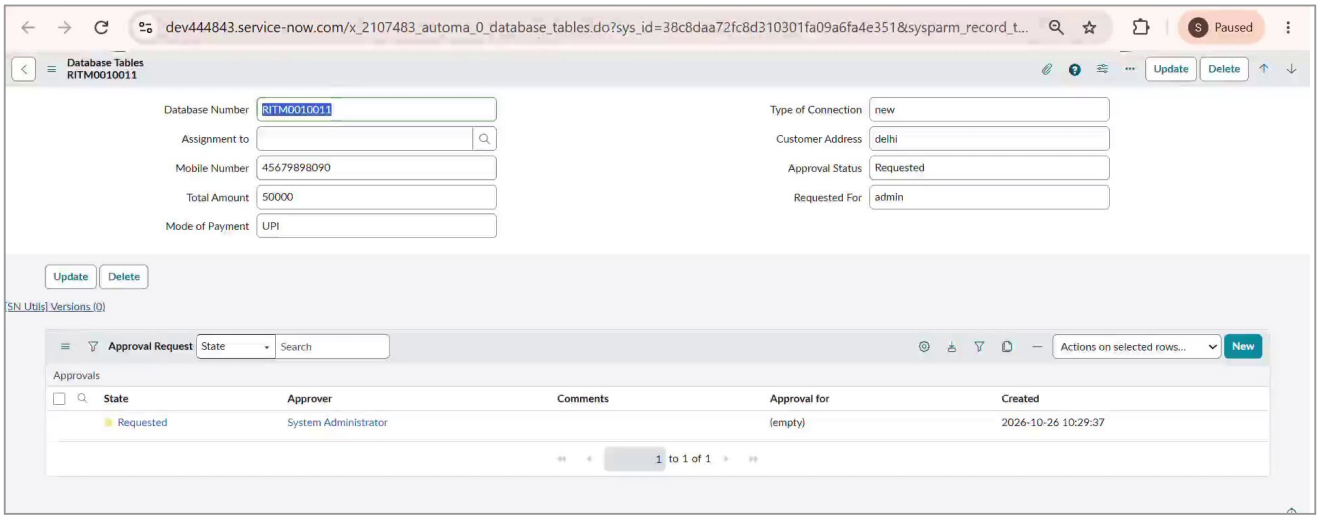

Figure 9: Database Tables record with Approval Status = Requested and its approval record.

Step 8: Approve the request

Action: Open the approval record and choose Approve (as the approver).

Expected result: The approval record State becomes Approved.

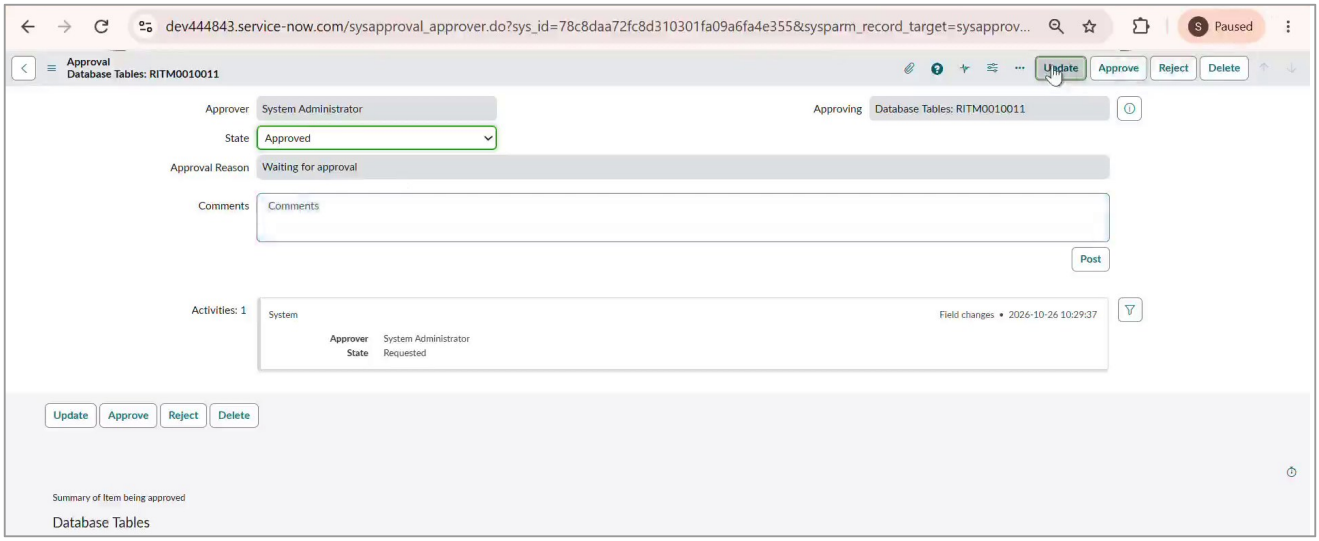

Figure 10: Approval record for the Database Tables record (State: Approved).

Step 9: Check the updated request record

Action: Return to the Database Tables record.

Expected result: Approval Status = Approved and Assignment to = ITIL User, set by the approved branch of the flow.

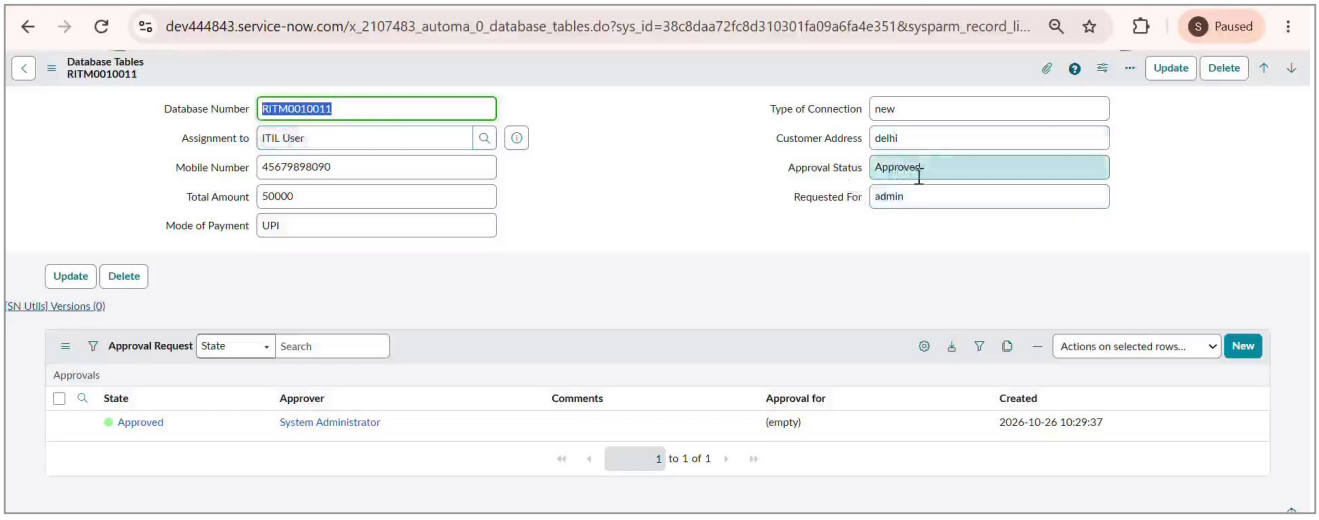

Figure 11: Record after approval: Approved, Assignment to = ITIL User.

Step 10: Create the network task (manual step)

Action: Create a new Network Task Table record linked to the request: Database Number, Request Number, Requested For, Approval Status, Work Status, Assigned to, Description and Work Notes.

Expected result: The task receives a generated number (NTT0000113 here). **This step is manual; the flow does not create the task automatically.**

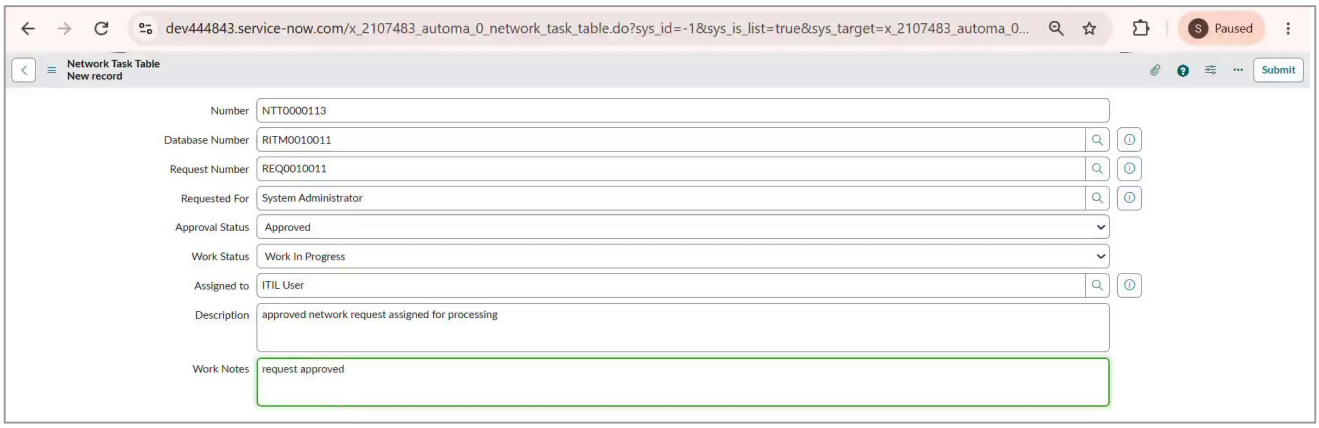

Figure 12: New Network Task Table record with Work Status = Work In Progress.

Step 11: Complete the task

Action: Open the task and set Work Status to Completed, then update the record.

Expected result: The Network Task Completion Email flow runs because Work Status changed to Completed.

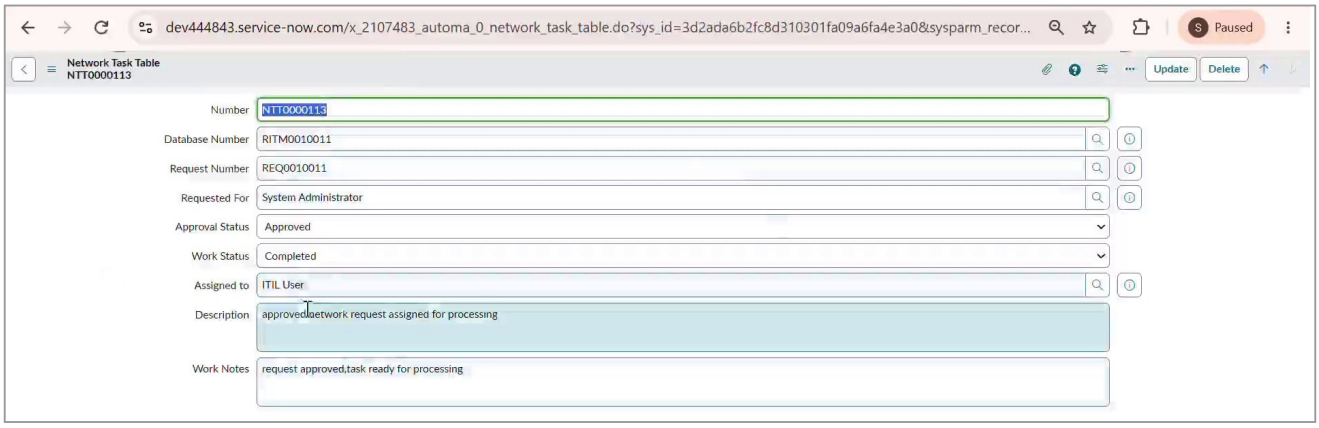

Figure 13: Network Task Table record with Work Status = Completed.

Step 12: Check the resolution email

Action: Open the Outbox and find 'Request has been Resolved'; use Preview Email.

Expected result: The email is in state Ready and greets the Requested For user by name, saying the ticket has been resolved.

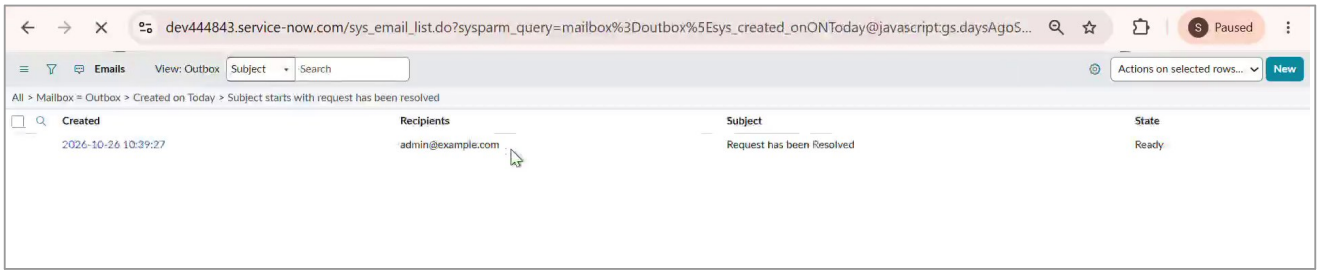

Figure 14: Outbox entry 'Request has been Resolved' (State Ready).

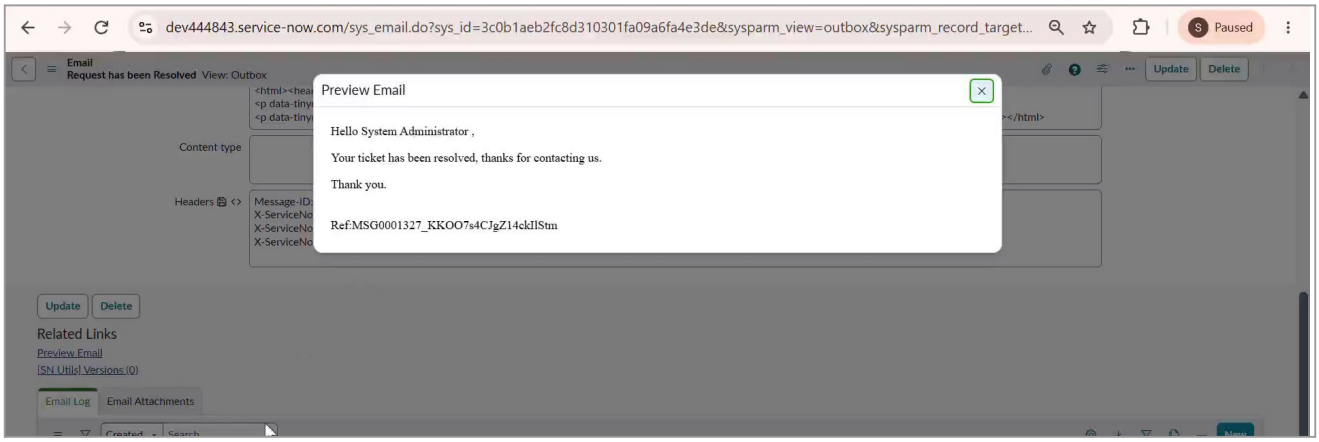

Figure 15: Preview of the resolution email.

Step 13: Under the hood: the Network Request flow

Action: Open the Network Request flow in Flow Designer (App Engine Studio).

Expected result: The activated flow lists Get Catalog Variables, Create Record, Send Email, Ask For Approval and an If / Else with Update Record actions.

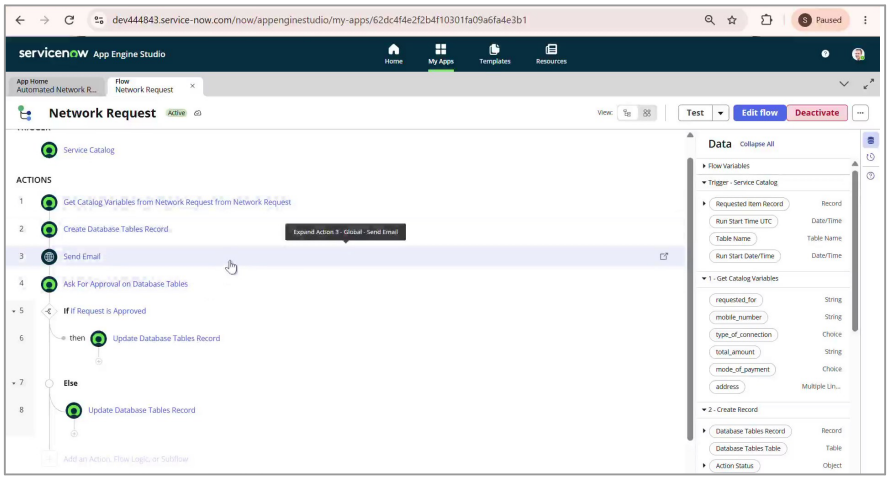

Figure 16: Network Request flow in Flow Designer.

5. Summary of results

Check	Result in the recorded demonstration
Conditional Existing ID	Shown and mandatory for Existing; hidden for New
Request record creation	Database Tables record created with Approval Status = Requested
Approval	Approval record created; approval set Approved and ITIL User
Task tracking	Task record created manually and linked to the request
Emails	Both emails generated in the Outbox with state Ready

6. Notes and limitations

- Network Task Table records are created manually; automatic creation is future work.
- The rejection branch (Rejected, Abraham Lincoln) is configured but was not demonstrated in this recording.
- An Outbox state of Ready shows the email was generated and queued; it does not prove inbox delivery.
- Mobile Number is not marked as required on the form in the recording, and has no custom ten-digit validation.
- This is a prototype in a developer instance, not a production network-provisioning platform.
