PURPOSE / VISION

Give requesters of network services a structured, trackable request process with timely updates, using ServiceNow low-code capabilities (prototype).

Define CS, fit into CC

1. CUSTOMER SEGMENT(S) — CS

Who is your customer? i.e. working parents of 0-5 y.o. kids

- Requesters: employees and other users who need a new or existing network connection or a related network service.
- Approvers: for example the System Administrator, who decide on requests.
- Network Team members who carry out the work.
- Administrators who maintain the application.

6. CUSTOMER CONSTRAINTS — CC

What constraints prevent your customers from taking action or limit their choices of solutions? i.e. spending power, budget, no cash, network connection, available devices.

- Users must know which details a request needs (mobile number, connection type, amount, payment mode, address; Existing ID for existing connections).
- Approval depends on an approver being available.
- Users need access to the ServiceNow Service Portal and a working email set-up.
- The prototype runs in a developer instance, not a production environment.

5. AVAILABLE SOLUTIONS — AS

Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? i.e. pen and paper is an alternative to digital notetaking

- Typical alternatives (not from a user study): requests by email, phone or message; spreadsheets; manual approval by forwarding messages.
- Pros: quick to start, no set-up. Cons: incomplete details, repeated entry, hard to track, no linked approval or task records.
- Differentiate: dedicated network request form, conditional Existing ID, flow-based approval, task tracking and two emails in one platform.

Explore AS, differentiate

Focus on J&P, tap into BE, understand RC

2. JOBS-TO-BE-DONE / PROBLEMS — J&P

Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one; explore different sides.

- Requester: submit a complete network request quickly and know it was received.
- Approver: decide on a request with its details in front of them.
- Network Team: know which task belongs to which request and mark it complete.
- Requester: be told when the request is resolved.

9. PROBLEM ROOT CAUSE — RC

What is the real reason that this problem exists? What is the back story behind the need to do this job? i.e. customers have to do it because of the change in regulations.

- Request details are collected without a structured form, so information is missing and entered repeatedly.
- Approvals and tasks are handled manually without linked records, causing delays and unclear responsibility.
- No automatic acknowledgement or resolution message, so users are unsure of progress.
- Inconsistent checking of submitted information.

7. BEHAVIOUR — BE

What does your customer do to address the problem and get the job done? i.e. directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace)

- Typical current behaviour (assumed, not surveyed): users send details by email, phone or chat and later ask for status updates.
- Approvers respond when they notice a request.
- Users already use web portals and email, so a portal form plus email notices fits existing habits.

Focus on J&P, tap into BE, understand RC

Identify strong TR & EM

3. TRIGGERS — TR

What triggers customers to act? i.e. seeing their neighbour installing solar panels, reading about a more efficient solution in the news.

- A user needs a new network connection or a change to an existing one.
- Receiving the request-created email prompts the requester to note the request number.
- An approval request prompts the approver to act.
- Work Status = Completed triggers the resolution email.

4. EMOTIONS: BEFORE / AFTER — EM

How do customers feel when they face a problem or a job and afterwards? i.e. lost, insecure > confident, in control - use it in your communication strategy & design.

- Before: uncertain whether the request arrived, frustrated by repeated entry and chasing.
- After (intended, not measured): more confident, with a request number, a two business working day timeframe and a resolution notice.

10. YOUR SOLUTION — SL

If you are working on an existing business, write down your current solution first, fill in the canvas, and check how much it fits reality. If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer behaviour.

- A ServiceNow scoped low-code application built in App Engine Studio.
- Network Request catalog item in the Service Portal (/sp): required fields, Existing ID shown only for Existing connections, requester details auto-populated.
- Network Request flow: creates a Database Tables record, sends 'Request has been Created', asks for approval and updates Approved or Rejected.
- Network Task Table tracks Work Status (task records are created manually).
- Network Task Completion Email flow sends 'Request has been Resolved'.
- Limits: prototype; rejection branch not freshly tested; Outbox state Ready shows the email was queued, not delivered.

8.1 ONLINE — CH

What kind of actions do customers take online? Extract online channels from #7

- Service Portal (/sp) catalog item.
- Emails generated by the flows (viewed in the ServiceNow Outbox).
- Approval records and related list in ServiceNow.

8.2 OFFLINE — CH

What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development.

- No offline channel is built into the application.
- Phone, paper or spreadsheet habits are what the solution aims to replace; an offline channel is outside the current scope.
